Sequence 8, Application US/0999672

Sequence 8, Application US/0999672

Patent No. US20020127655A1

GENERAL INFORMATION:

APPLICANT: Eric H. Holmes et al.

TITLE OF INVENTION: GMI-SPECIFIC ALPHAI-2 FUCOSYLTRANSFERASE AND USES

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: US/09/999,672

CURRENT APPLICATION NUMBER: US/09/999,672

CURRENT FILING DATE: 2001-10-31

PRIOR APPLICATION NUMBER: US/09/298,886

PRIOR PRILING DATE: 1999-04-26

NUMBER OF SEQ ID NOS: 29

SOFTWARE: Patentin Ver. 2.0

LENGTH: 380

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Db
Galactoside 2-alpha-L-fucosyltransferase (EC 2.4.1.69) B - rat (fragment)
N;Alternate names: alpha-1,2-fucosyltransferase
N;Alternate names: alpha-1,2-fucosyltransferase
C;Species: Rattus norvegicus (Norway rat)
C;Date: 26-Dec-1994 #sequence_revision 23-Feb-1996 #text_change 08-Oct-1999
C;Accession: S46494

population of South Africa.";

Hum. Genet. 103:204-210(1998).

-1- FUNCTION: CREATES A SQLUBLE PRECURSOR OLIGOSACCHARIDE FUC-ALPHA
((1,2)GALBETA-) CALLED THE H ANTIGEN WHICH IS AN ESSENTIAL
SUBSTRATE FOR THE FINAL STEP IN THE SQLUBLE A AND B ANTIGEN
SYNTHESIS PATHWAY. H AND SE ENZYMES FUCOSYLATE THE SAME ACCEPTOR
SUBSTRATES BOT EXHIBIT DIFFERENT KN VALUES.
-- CATALYTIC ACTIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP +
alpha-L-fucosyl-1,2-beta-D-galactosyl-R.
--- PATHWAY: GlyCOSYLAION.
--- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
--- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND
--- STEMBNANTURE DOCUMENT AND SECOND AND STEMBLE OF GOLG.

Molecular cloning and expression of two types of rabbit beta-
molecular cloning and expression of two types of rabbit beta-
galactoside alpha 1.2-fucosyltransferase.";

J. Biol. Chem. 270:8844-8850(1995).

-!- FUNCTION: CREATES A SOLUBLE PRECURSOR OLIGOSACCHARIDE FUC-ALPHA
((1,2)GALBETA-) CALLED THE HANTIGEN WHICH IS AND ESSENTIAL
SUBSTRATE FOR THE FINAL STEP IN THE SOLUBLE AND B ANTIGEN
SUBSTRATES BUT EXHIBIT DIFFERENT KW VALUES.

-!- CAPALITIC ACTIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP -
alpha-L-fucosyl-1,2-beta-D-galactosyl-R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN) (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                313

HAND SE BNITHES FUGGELATE

-!- CATALYTIC ACTIVITY: GDP-L-fucose + beta-D-galactosyl-R = GDP + alpha-L-fucosyl-1.2. beta-D-galactosyl-R.
-!- PATHWAY: Glycosylation.
-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND FORM IN TRANS CISTERNAE OF GOLGI (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: TYPE IN MEMBRANE PROTEIN. MEMBRANE-BOUND GALACTOSIDE 2-L-FUCOSYLTRANSFERASE. THEY ARE EXPRESSED IN A TISSUE-SPECIFIC MANNER.

(allphal-ZFucT) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate moiety found in ganglioside GML, at terminal galactose betal-3N-acety/galactosamine (Galbetal-3GalNAc) accharide. Alphal-ZFucT DNA is useful for producing rat alphal-ZBucT DNA is useful for producing rat alphal-ZFucT DNA is useful for detecting oncognic transformation which alphal-ZFucT DNA is useful for detecting oncognic transformation which alphal-ZFucT is activated in cell transformation, antisense sequences derived from alphal-ZFucT DNA are useful for inhibiting, suppressing or treating cancer. Alphal-ZFucT DNA is useful in gene therapy and all the present sequence is rat hepatoma H35 cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rat hepatoma H35 celi alphal-2fucosyltransferase, useful for producing GMJ-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LGNQMGEYATLFALARMNGRLAFIPASMHNALAPIFRISLPVLHSDTAKKIPWQNYHLND 120

The protein or its cellular fraction is useful for synthesis of a molecule comprising rucalphal-2Galbetal-3GalNac, a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNac. The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNac group. It is also useful for synthesis of fucosyl-GM_1 by contacting the protein with GDP-fucose and ganglioside GM_1. The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GM_1 is useful for inducing an intrinsipal compositions and fucosyl-GM_1 is useful for inducing an

(alphal-2Fucr) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate moiety found in ganglioside GM1, a terminal galactose betal-3N-acetylgalactosamine (Galbetal-3GalNac) saccharide. Alphal-2Fucr DNA is useful for producing rat alphal-2Fucr protein by recombinant techniques. Alphal-2Fucr DNA is useful for proper protein by recombinant techniques. Alphal-2Fucr DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoproteins, glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues

Alphal-2FucT DNA is useful for detecting oncogenic transformation which
           involves assaying for changes in expression of alphal-2 Fucr. Since alphal-2Fucr is activated in cell transformation, antisense sequences derived from alphal-2Fucr DNA are useful for inhibiting, suppressing or treating cancer. Alphal-2Fucr DNA is useful in gene therapy and antisense therapy. The present sequence is rat hepatoma H35 cell alphal-2Fucr catalytic domain.
                                                                                                                                                                                                                                                                                                           185
                                                                                                                                                                                                                                                                                                                                                                 245

This polypeptide comprises porcine secretor glycosyltransferase (SE or FUT2), a type II integral membrane protein has high affinity for type I and type III substrates. Its amino acid sequence was deduced from the nucleotide sequence of a genomic DNA clone (see AAV29003) isolated from a pig liver library on the basis of homology to human FUT2 cDNA. Pig FUT2 shows 83.2% identity with human FUT2. Expression of a glycosyltransferase, such as porcine Se, in a tissue results in reduced expression of unwanted carbohydrate pancreas, rendering if more suitable for transplantation, i.e. less immunogent and of increased immunological acceptablity. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing levels of carbohydrate on the donor cell that causes it to be recognised as non-sell by the recipient by expressing a nucleic acid for a glycosyltransferase such as porcine Se in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WMEERYRHIPGHFVRFTGYPCSWTFYHHLRPEILKEFTLHDHVREEAQAFLRGLRVN3SQ 180

This sequence is the human Sec2 protein of the invention. The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2) fucosyltransferase locus, that cross hybridises with the H blood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase (FOT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allele of the FOT2 gene that has a stop codon in the position corresponding to amino acid 143.
                                                                                                                                                                                    Sec2; alpha(1,2) fucosyltransferase; H blood group; secretor genotyping; GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WMEERYRHIPGHFVRFTGYPCSWTFYHHLRPEILKEFTLHDHVREEAQAFLRGLRVNGSQ 180

The present invention describes nucleic acids (NA) encoding a chimeric glycosyltransferase. The NAs comprise a catalytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimeric enzyme is located in a mera of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT. The NAs can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the expitopes in cells, tissues or organs which may be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LGNQMGEYATLFALARMNGRLAFIPASMHNALAPIFRISLPVLHSDTAKKIPWQNYHLND 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is given in a specification relating to a rat ganglioside GM.1-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-2Galbetal-3GalNAc, a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNAc. The method involves contenting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNAc group. It is also useful for synthesis of fucosyl-GM.1 by contacting the protein with GDP-fucose and ganglioside GM.1 The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GM.1 is useful for inducing an increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3;

The functional protein is represented by amino acids 33 to 365. The enzyme produced by the DNa sequence can be used in enzymatic fucosylation of chain-terminating galactose residues on lactoseamine or neolacto type beta-D-galactoside to alpha-2-L-fucose residues.                                                                                                                                                                                                                                                                                                                                                                                                                GDP-L-fucose-beta-D-galactoside 2-alpha-fucosyl-transferase (Fuc-T) is encoded by cDNA (AAQ98461) isolated from a human epidermal carcinoma cell line. The enzyme is responsible for the synthesis of 2'-fucosyllactose, one of the oligosaccharides in human milk. Other products of Fuc-T include glucoprotiens contq. beta-linked terminal galactose residues which can be fucosylated by Fuc-T. This DNA can be used to produce non-human transgenic mammals able to produce secondary gene products, e.g. oligosaccharides, in their milk. The transgenic mammals milk biochemically resembles human milk. This humanised milk can be used in the prepn. of an enteral nutritional product useful in the nutritive maintenance of an animal.

(AAT01082) isolated from a human epidermal carcinoma cell line A431 cDNA library. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn. of oligosaccharides or glycosylated proteins and lipids in the milk.
                                                                                                                                                                                                                                                                                                                                                                      Redn. of rejection of xenogeneic cells following transplantation by introducing a vector expressing fucosyl:transferase into the cells

             The human H-transferase (AAR90572) product of a cDNA clone (AAT12238) prepd. from human epidermoid carcinoma cells (AIGC CRL 155 A-431) can be expressed in xenogeneic organs, tissues and cells using a vector such as pAPEX-1 (AAT12239). This results in decreased expression of the non-human antigen galactose alpha(1,3) galactose non the surface of the organs etc. so that hyperacute rejection is reduced upon transplantation to humans.
                                                                                                                                                                                                                                                                                                                            150 RPEILKEFTLHDHVREEAQAFLRGLRV--NGSQPSTFVGVHVRRGDYVHVMPNVWKGVVA 207

A claimed transgenic mouse expresses, in its intestinal epithelial cells, the enzyme human GDP-L-fucose.beta-D-galactoside 2-alpha-L-fucosyltransferase (also called alpha 1,2 FT) or human GDP-L-fucose.beta-D-N-acetylglucosamide 3/4-alpha-L-fucosyltransferase (also called alpha 1,3/4 FT). The enzyme is expressed under the control of a gut epithelial cell-specific promoter and Helicobacter pylori adheres to the transgenic cells. The transgenic mouse and intestinal epithelial cells from it are useful as models for screening compounds for the ability to inhibit adhesion of H. pylori to gut epithelial cells. The present sequence represents human alpha 1,2 FT and was published by Larsen et al., Proc.Natl.Acad.Sci.USA, 87:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         267

Human GDP-Fuc:beta-D-galactoside alpha(1,2)-fucosyltransferase (AAW13640) is an enzyme involved in the expression of type I and II blood group in structures. Its amino acid sequence was deduced from an isolated DNA (AAT61677) derived from human A431 cells. Expression of the fucosyltransferase animal cell lines provides specific capabilities with respect to post-translational modification of the oligosaccharides of expressed proteins or lipids. Specific applas. Of the enzyme include enzymatic fucosylation of chain-terminating galactose residues on lactoseamine or neolacto type beta-D-galactoside to alpha-2-fucose residues. The enzyme can also be used to raise antibodies as diagnostic reagents and to screen cpds. for fucosyltransferase inhibitor activity.
                                                                                                                                                         New recombinant fucosyltransferase proteins - useful for modifying cell surface oligosaccharide structures
                                                                                                                                                                                                                 Example 1; Page 280-281; 329pp; English.
